Phone 352-372-7022
Fax 352-372-7066

HGNC Name: SNCB

RRID: NA

Format: 1mg/mL in 6M Urea

Storage: Store at -20°C

UniProt: Q16143

Applications	Host	Molecular Wt.	HGNC	UniPort
Western blotting, ELISA, immunogen	E. coli	~21kDa	SNCB	Q16143

Coomassie Brilliant Blue staining of SDS-PAGE gel of recombinant human synuclein proteins. Lane 1 shows protein standards of apparent molecular weight as indicated in kDa. Other lanes show ~2 μ g of [2] α -synuclein, [3] β -synuclein, and [4] γ -synuclein. Lanes [5] and [6] show 2.0 and 1.0 μ g of BSA respectively.

Background:

β -synuclein is a member of the synuclein protein family, the other two members being α and γ -synuclein, each protein being coded for by a distinct but related gene. α -synuclein was originally isolated as a major synaptic vesicle associated protein from the electric organ of the fish *Torpedo* (1), and direct homologues of α -synuclein are found in all vertebrates. Later work connected α -synuclein expression with several human brain pathologies, so that it is a major component of the Lewy bodies of Parkinson's disease (2-5). β -synuclein was isolated as a component of normal and diseased human brain as a protein clearly related to but distinct from α -synuclein (6). The human β -synuclein molecule is 134 amino acids in size compared to 140 amino acids for α -synuclein, and the N-terminal halves of the two molecules are virtually identical while the C-terminal regions is more variable. As a result we made our new β -synuclein antibodies to this region. Like α -synuclein, β -synuclein is heavily concentrated in the brain in presynaptic regions. A third synuclein, γ -synuclein was originally identified as breast cancer specific gene 1, (BCSG1), but is also heavily expressed in brain and also has a similar N-terminal sequence. The three synucleins appear to have overlapping functions so genetic deletion of all three in mice is required to obtain serious neurological deficits (7).

A codon optimized cDNA encoding full length human β -synuclein was designed and inserted into the pET30a(+) expression vector. The vector adds an N-terminal His-tag, S-tag and proteolytic cleavage sites to the human sequence which increases the molecular weight by about 5kDa. The construct was expressed by standard methods in *E. coli* and purified using a Nickel column in 6M urea. The protein is supplied in 6M urea in phosphate buffer.

FOR RESEARCH USE ONLY. NOT INTENDED FOR DIAGNOSTIC OR THERAPEUTIC USE.
